PetroQuip's **SandStorm-E** separates sand and other solids from the produced fluid before it enters the ESP. The vortex created inside the tool pushes sand and solids down into a sump or tail pipe below. Unique design has no internal fins which creates longer tool life.

Advantages and Features

- Extends the life of the ESP by reducing the sand and other solids from the produced fluid
- One size for all flow rates
- No internal fins to erode
- Available with integral cup packer or run below standard retrievable packer
- All internal components hardened with Boron and Tungsten Carbide to reduce erosional wear and prolong life
- Minimal pressure drop through the tool
- Multiple weight tubing sizes and weights serviced by the same tool by changing packer cups

As the flow enters the ports and starts to spin (black is both sand and produced fluids), the heavier sand particles are pushed to the ID of the SandStorm-E, and the lighter (green) produced fluids are pushed to the center of the SandStorm-E. There becomes two separate cyclones of lighter and heavier fluids and particles spinning. The heavier (brown outer cyclone) is pushed down the cone into the sump below. The lighter (green inner cyclone) is sucked up the hole by the ESP above.
